Submission Date: August 12, 2026

1. Abstract

This project presents “Online Shop” (branded as LUNORA), a multi-page, responsive front-end e-commerce website for a fashion retailer, developed using HTML, CSS, and JavaScript. The website includes a home page featuring a banner, category navigation, promotional tiles, a best-sellers grid, a newsletter sign-up, and a contact form, along with four dedicated collection pages for Women, Men, Dresses, and Accessories. The site was built by a team of three students, each responsible for a distinct section of the design, and later merged into a single, consistent project. The final product demonstrates the practical application of semantic HTML structure, CSS layout techniques (Flexbox and media queries), and JavaScript-based interactivity, including a mobile navigation menu and an EmailJS-powered contact form.

2. Introduction

This project was developed for the CTP Class as a final project to apply and demonstrate front-end web development skills. The objective was to design and build a fully functional, visually appealing online shopping website from HTML for structure, CSS for styling and responsiveness, and JavaScript for interactivity.

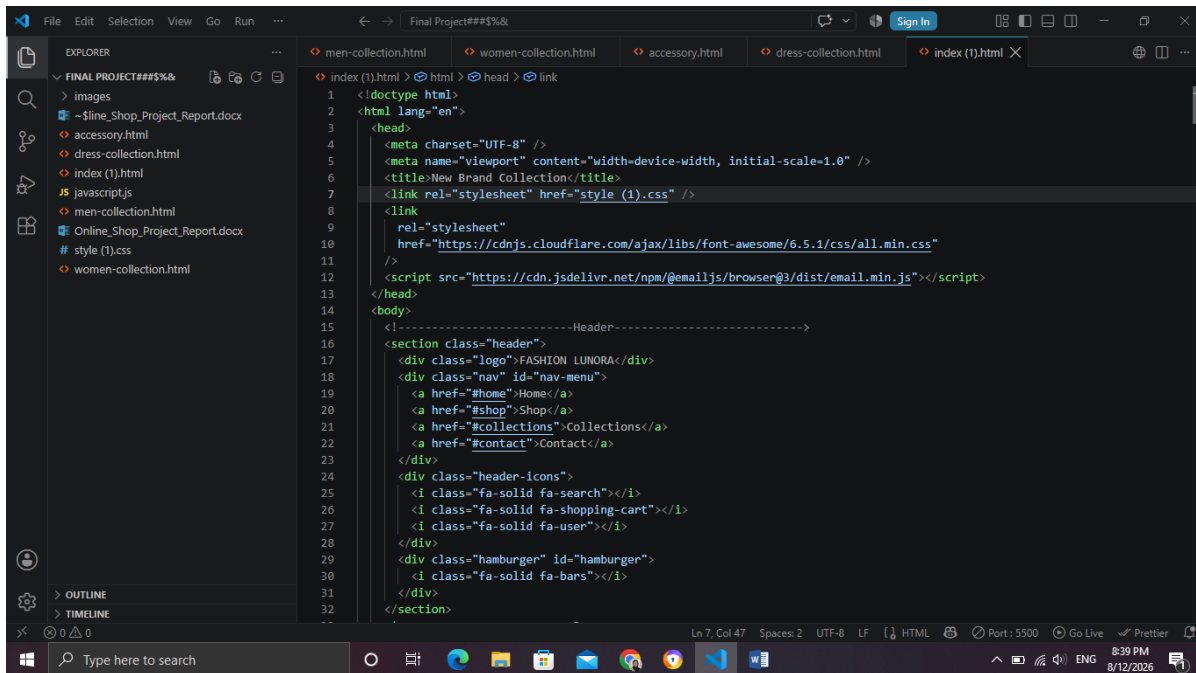

The chosen concept, “Online Shop,” is a fashion e-commerce storefront named LUNORA. The site was designed to reflect a clean, modern aesthetic suitable for an online clothing brand, and to give the team hands-on experience with real-world web development practices such as component-based layout design, responsive design for mobile devices, cross-file linking, and collaborative version control of shared code.

3. Methodology / Implementation

The website was built using three core technologies: HTML for page structure and content, CSS for visual styling and responsive layout (using Flexbox and media queries), and JavaScript for interactive behavior. Font Awesome 4 was used as the icon library for navigation and social media icons, and EmailJS was integrated to allow the contact form to send messages directly from the browser without a server-side backend.

Project Structure

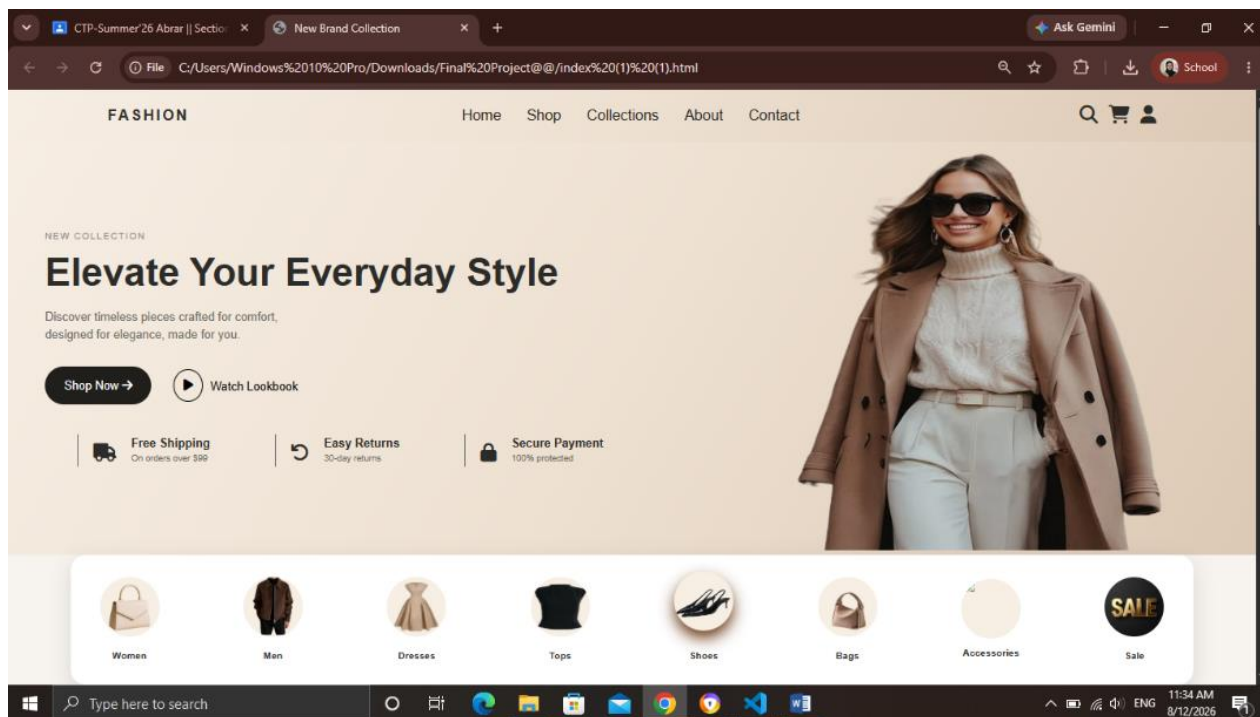

- index.html — the home page, containing the header, banner, category icons, “Shop by Category” section, promotional tiles, best-sellers grid, features list, newsletter section, contact form, and footer.
- women-collection.html, men-collection.html, dress-collection.html, accessory.html — dedicated product-listing pages for each category, sharing the same header, footer, and product grid layout as the home page.
- style.css — a single shared stylesheet controlling the look of all pages, including responsive breakpoints for tablet and mobile screens.
- javascript.js — handles the mobile hamburger-menu toggle and the EmailJS contact-form submission.

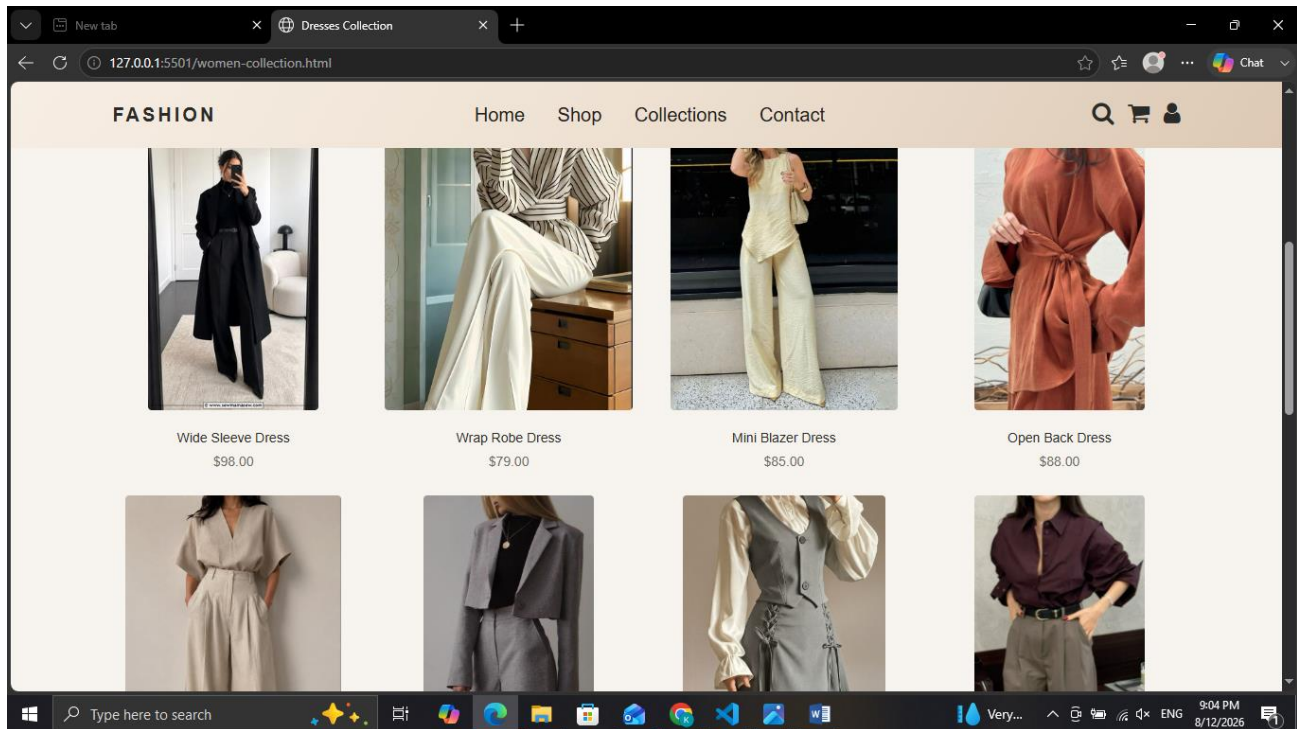

```

13 </head>
14 <body>
15 <!--Header-->
16 <section class="header">
17 <div class="logo">FASHION LUNORA</div>
18 <div class="nav" id="nav-menu">
19 <a href="#home">Home</a>
20 <a href="#shop">Shop</a>
21 <a href="#collections">Collections</a>
22 <a href="#contact">Contact</a>
23 </div>
24 <div class="header-icons">
25 <i class="fa-solid fa-search"></i>
26 <i class="fa-solid fa-shopping-cart"></i>
27 <i class="fa-solid fa-user"></i>
28 </div>
29 <div class="hamburger" id="hamburger">
30 <i class="fa-solid fa-bars"></i>
31 </div>
32 </section>
```

4. Results / Output

The final website is a fully styled, multi-section fashion storefront. The home page presents a warm, neutral color palette with a banner, a category bar, a “Shop by Category” section with four large image cards, two promotional tiles, a best-sellers product grid with hover effects, a features list, a newsletter sign-up, and a working contact form.

Each collection page (Women, Men, Dresses, Accessories) reuses the same header, toolbar, and card-grid layout to display twelve products per category with a product image, name, and price, keeping the browsing experience consistent across the site.

5. Challenges and Limitations

Group Work and Task Distribution

Since we were three members in the group, we divided the project into different sections. Each member was responsible for developing a specific part of the website. We worked separately on our assigned sections and tried to complete our parts according to the project requirements.

Dividing the work helped us manage the project more easily and allowed each member to focus on a particular part of the website. We used HTML to create the structure, CSS to design and style the website, and JavaScript to add functionality and interaction.

Challenges We Faced

The main challenge occurred when we tried to combine all three members' code into one complete project. Although each section worked relatively well when developed separately, problems appeared after we merged the code.

Some class names, IDs, variables, and styling properties were similar or had the same names across different sections. As a result, some CSS styles affected other parts of the website. This caused the website to become disorganized, and some parts did not work as expected.

Problem Solving

To solve these problems, we checked the code carefully and compared the different sections. We identified repeated or conflicting class names, IDs, and renamed or reorganized them. We also tested different parts of the website after combining them to find where the conflicts were happening.

This experience taught us that when working on a group coding project, it is important to agree on naming conventions and the overall project structure before starting. It is also important to communicate regularly with group members and check how the different parts of the project work together.

Another challenge was the limited time available to complete the project. It was the final week of the semester, and we also had quizzes, assignments, and other academic responsibilities. Because of the limited time, we did not have enough time to add more features, improve the design, and properly fix all the coding conflicts after combining our sections. As a result, we had to complete the project with the time we had available.

6. Conclusion and Discussion

Overall, the project was completed successfully. The team was able to design and build a responsive, multi-page fashion e-commerce website using HTML, CSS, and JavaScript, meeting the visual and functional requirements set out for the assignment. Beyond the technical outcome, the project gave the team practical experience in dividing work across a group, maintaining a shared codebase, and resolving naming and styling conflicts that arise when merging independently developed code into a single project.

7. Future Work

- Add individual product detail pages and a functional search feature.
- Add more pages to the website.
- Provide more detailed information about the products.
- Add a complete purchase/order form.
- Create a detailed About Us page.
- Introduce the company and its background.
- Add information about the company's employees.
- Add more features to make the website more complete and functional.

8. References

- Font Awesome (icon library) — <https://fontawesome.com/v4/get-started/>
- EmailJS (contact form email service) — <https://dashboard.emailjs.com/sign-in>

9. Individual Contributions

Shakila Kazimi — Home Page Development, Content Research, and Documentation

Developed the header, banner, and Products section of the Home page. She also researched and selected images and other visual content for the website and contributed to writing the project report.

Morsal Haidari — Home Page Sections and Template Research

Developed the Shop by Category and Best Sellers sections of the Home page. She also researched and identified suitable website templates to provide ideas and inspiration for the project's design and layout.

Khadija Alizada — Front-End Development and Final Editing

Developed the Home page form and footer, created the Collections pages, implemented the website's JavaScript functionality, and completed the final editing and refinement of the website after integrating all team members' code.
